I. COURSE OUTCOME 1(CO1)

PROGRAM NO: 1

DATE:24/11/2021

AIM: Familiarizing Text Editor, IDE, Code Analysis Tools etc // Use any IDE IDE

An IDE (or Integrated Development Environment) is a program dedicated to software development. As the name implies, IDEs integrate several tools specifically designed for software development. These tools usually include:

- An editor designed to handle code (with, for example, syntax highlighting and auto-completion)
- Build, execution, and debugging tools
- Some form of source control

Most IDEs support many different programming languages and contain many more features. They can, therefore, be large and take time to download and install. You may also need advanced knowledge to use them properly.

In contrast, a dedicated code editor can be as simple as a text editor with syntax highlighting and code formatting capabilities. Most good code editors can execute code and control a <u>debugger</u>. The very best ones interact with source control systems as well. Compared to an IDE, a good dedicated code editor is usually smaller and quicker, but often less feature rich.

General Editors and IDEs with Python Support

1. Visual Studio

Built by Microsoft, Visual Studio is a full-featured IDE, in many ways comparable to Eclipse. Built for Windows and Mac OS only, VS comes in both free (Community) and paid (Professional and Enterprise) versions. Visual Studio enables development for a variety of platforms and comes with its own marketplace for extensions.

Python Tools for Visual Studio (aka PTVS) enables Python coding in Visual Studio, as well as Intellisense for Python, debugging, and other tools.

Not to be confused with full Visual Studio, Visual Studio Code (aka VS Code) is a full-featured code editor available for Linux, Mac OS X, and Windows platforms. Small and light-weight, but full-featured, VS Code is open-source, extensible, and configurable for almost any task. Like Atom, VS Code is built on Electron, so it has the same advantages and disadvantages that brings.

Installing Python support in VS Code is very accessible: the Marketplace is a quick button click away. Search for Python, click Install, and restart if necessary. VS Code will recognize your Python installation and libraries automatically.

Pros: Thanks to Electron, VS Code is available on every platform, surprisingly full-featured despite having a small footprint, and open-source.

Cons: Electron means VS Code is not a native app. Plus, some people may have principled reasons to not use Microsoft resources.

2.Pycharm

One of the best (and only) full-featured, dedicated IDEs for Python is <u>PyCharm</u>. Available in both paid (Professional) and free open-source (Community) editions, PyCharm installs quickly and easily on Windows, Mac OS X, and Linux platforms.

Out of the box, PyCharm supports Python development directly. You can just open a new file and start writing code. You can run and debug Python directly inside PyCharm, and it has support for source control and projects.

Pros: It's the de facto Python IDE environment, with tons of support and a supportive community. It edits, runs, and debugs Python out of the box.

Cons: PyCharm can be slow to load, and the default settings may need tweaking for existing projects.

3.Thonny

A recent addition to the Python IDE family, Thonny is billed as an IDE for beginners. Written and maintained by the <u>Institute of Computer Science</u> at the <u>University of Tartu</u> in Estonia, Thonny is available for all major platforms, with installation instructions on the site.

By default, Thonny installs with its own bundled version of Python, so you don't need to install anything else new. More experienced users may need to tweak this setting so already installed libraries are found and used.

Pros: You're a beginning Python user, and want an IDE that's ready to roll.

Cons: More experienced Python developers will find Thonny too basic for most uses, and the built-in interpreter is something to work around, not with. Plus, as a new tool, there may be issues you find which may not have immediate solutions.

4.Spyder

Spyder is an open-source Python IDE that's optimized for data science workflows. Spyder comes included with the Anaconda package manager distribution, so depending on your setup you may already have it installed on your machine.

What's interesting about Spyder is that it's target audience is data scientists using Python. You'll notice this throughout. For example, Spyder integrates well with common Python data science libraries like SciPy, NumPy, and Matplotlib.

Spyder features most of the "common IDE features" you might expect, such as a code editor with robust syntax highlighting, Python code completion, and even an integrated documentation browser.

A special feature that I haven't seen in other Python editing environments is Spyder's "variable explorer" that allows you to display data using a table-based layout right inside your IDE.

Overall, I'd say that Spyder feels more basic than other IDEs. I like to view it more as a special purpose tool rather than something I use as my primary editing environment every day. What is nice about this Python IDE is that it is available for free on Windows, macOS, and Linux and that it is fully open-source software.

Pros: You're a data scientist using the Anaconda Python distribution.

Cons: More experienced Python developers might find Spyder too basic to work with on a daily basis and instead opt for a more complete IDE or customized editor solution.

DATE:24/11/2021

AIM: Display future leap years from current year to a final year entered by user.

```
s=int(input("enter start year:"))
e=int(input("enter end year:"))
if(s<e):
    print("leap years are:",end=" ")
for i in range(s,e):
    if i%4==0 and i%100!=0:
        print(i, end=" ")
else:
    print("Invalid")</pre>
```

OUTPUT:

enter start year:2021 enter end year:2050

leap years are: 2024 2028 2032 2036 2040 2044 2048

```
PROGRAM NO: 3
DATE:24/11/2021
AIM: List comprehensions:
(a) Generate positive list of numbers from a given list of integers
list = [-10,20,35,-67,70]
for i in list:
  if(i>0):
     print(i)
OUTPUT:
20
35
70
(b) Square of N number
n = int(input("Enter the limit:"))
for i in range(1,n+1):
  s = i*i;
  print(s)
OUTPUT:
Enter the limit:5
1
4
9
16
25
(c) Form a list of vowels selected from a given word
word =input("Enter the word :")
print("The original string is : "+word)
print("The vowels are :")
for i in word:
  if i in "aeiouAEIOU":
     print([i])
OUTPUT
Enter the word :sreerag
The original string is: sreerag
The vowels are:
['e']
['e']
['a']
```

- 9 -

DATE:24/11/2021

AIM: Count the occurrences of each word in a line of text.

```
str1 = input("Enter a string : ")
wordlist = str1.split()
count= []
for w in wordlist:
    count.append(wordlist.count(w))
print("count of the occurrence:" + str(list(zip(wordlist, count))))
```

OUTPUT

Enter a string: Python is a programming language python count of the occurrence:[('Python', 1), ('is', 1), ('programming', 1), ('language', 1), ('python', 1)]

DATE:24/11/2021

AIM: Prompt the user for a list of integers. For all values greater than 100, store 'over' instead

```
n=[]
s=int(input("Enter a limit:"))
print("Enter {s} values :")
for i in range(0,s):
    n.append(int(input()))
    print("\nThe list after assinging:\n")
for i in range(0,len(n)):
    if n[i]>=100:
        print("over!!")
    else:print(n[i])
```

OUTPUT

Enter a limit:2
Enter {s} values
24
199
The list after assinging:
24
over

DATE:24/11/2021

AIM: Store a list of first names. Count the occurrences of 'a' within the list

lst = ["a","b","c","a"]
occ = lst.count("a")
print("Occurrences of 'a' :",occ)

OUTPUT

Occurrences of 'a': 2

DATE:24/11/2021

```
AIM: Enter 2 lists of integers. Check
       (a) Whether list are of same length
        (b) whether list sums to same value
        (c) whether any value occur in both
lst=[1,3,5,7,9,11,34]
lst1=[5,13,45,7,20,65,1]
s=int(0)
c=int(0)
if len(lst)==len(lst1):
 print("Lists are of same length")
else:
 print("Lists have different length")
for i in range(0,len(lst) and len(lst1)):
 s=s+lst[i]
 c=c+lst1[i]
if(s==c):
 print("equal sum")
else:
 print("not same sum")
print("Elements that matched are:")
1=[]
for i in range(0,len(lst)):
 for j in range(0,len(lst1)):
  if lst[i] == lst1[j]:
     l.append(lst[i] and lst1[j])
  else:
    continue
print(l)
```

OUTPUT

Lists are of same length not same sum Elements that matched are: [1, 5, 7]

DATE:24/11/2021

AIM: Get a string from an input string where all occurrences of first character replaced with '\$', except first character. [eg: onion -> oni\$n]

```
str = "onion"
char = str[0]
str = str.replace(char, '$')
str = char + str[1:]
print(str)
```

OUTPUT

oni\$n

DATE:24/11/2021

AIM: Create a string from given string where first and last characters exchanged. [eg: python -> nythop]

```
str = input("Enter a string :")
newstr = str[-1:] + str[1:-1] + str[:1]
print("New string :",newstr)
```

OUTPUT

Enter a string: python New string: nythop

DATE:24/11/2021

AIM: Accept the radius from user and find area of circle.

```
\begin{split} pi &= 3.14 \\ r &= float(input("Enter the radius of circle :")) \\ area &= pi*r**2 \\ print("Area of circle :", area) \end{split}
```

OUTPUT

Enter the radius of circle :2 Area of circle : 12.56

DATE:29/11/2021

AIM: Find the biggest of three numbers entered

```
a = int(input("Enter First No:"))
b = int(input("Enter Second No:"))
c = int(input("Enter Third No:"))

if(a > b and a>c):
    print(a, "is largest")

elif(b > c):
    print(b, "is largest")

elif(c > a):
    print(c, "is largest")
```

OUTPUT

Enter First No:4 Enter Second No:9 Enter Third No:1 9 is largest

DATE:29/11/2021

AIM: Accept a file name from user and print extension of that.

```
file = input("Enter file name :")
f = file.split(".")
print("Extension of file is :",f[-1])
```

OUTPUT

Enter file name :sample.java Extension of file is : java

DATE:29/11/2021

AIM: Create a list of colors from comma-separated color names entered by user. Display first and last colors

```
a=[]
for i in range(3):
    b=input("enter the color:")
    a.append(b)
print(a)
print(a[0])
print(a[2])
```

OUTPUT

enter the color:Black enter the color:Blue enter the color:White ['Black', 'Blue', 'White'] Black White

DATE:29/11/2021

AIM: Accept an integer n and compute n+nn+nnn

```
\begin{split} n &= int(input("Enter \ a \ number \ :")) \\ x &= int("\%s" \ \% \ n) \\ y &= int("\%s\%s" \ \% \ (n,n)) \\ z &= int("\%s\%s%s" \ \% \ (n,n,n)) \\ print("n + nn + nnn \ :", \ x+y+z) \end{split}
```

OUTPUT

Enter a number :5 n + nn + nnn : 615

DATE:29/11/2021

AIM: Print out all colors from color-list1 not contained in color-list2.

```
lst1 = set(["White", "Pink", "Red", "Blue"])
lst2 = set(["Red", "Green", "Pink"])
print(lst1.difference(lst2))
```

OUTPUT

{'Blue', 'White'}

DATE:29/11/2021

AIM: Create a single string separated with space from two strings by swapping the character at position 1.

```
a = "Python"

b = "Java"

p1 = a[0]

p2 = b[0]

c = b[0] + a[1:len(a)]+" "+a[0] + b[1:len(b)]

print(c)
```

OUTPUT

Jython Pava

DATE:29/11/2021

AIM: Sort dictionary in ascending and descending order.

```
import operator
d = {1: 2, 3: 4, 4: 3, 2: 1, 0: 0}
print('Original dictionary : ',d)
sorted_d = sorted(d.items(), key=operator.itemgetter(1))
print('Dictionary in ascending order : ',sorted_d)
sorted_d = dict( sorted(d.items(), key=operator.itemgetter(1),reverse=True))
print('Dictionary in descending order : ',sorted_d)
```

OUTPUT

Original dictionary: {1: 2, 3: 4, 4: 3, 2: 1, 0: 0}

Dictionary in ascending order: [(0, 0), (2, 1), (1, 2), (4, 3), (3, 4)]

Dictionary in descending order: {3: 4, 4: 3, 1: 2, 2: 1, 0: 0}

DATE:29/11/2021

AIM: Merge two dictionaries

```
d1 ={ 'a': 100, 'b': 200}
d2 ={ 'x' : 300, 'y': 200}
print ("Dict ionary 1 :", d1)
print ("Dictionary 2 : ", d2)
d =d1. copy ()
d.update (d2)
print ("Merged Dictionary : ", d)
```

OUTPUT

Dictionary 1 : {'a': 100, 'b': 200} Dictionary 2 : {'x': 300, 'y': 200}

Merged Dictionary: {'a': 100, 'b': 200, 'x': 300, 'y': 200}

DATE:29/11/2021

AIM: Find the gcd of 2 numbers

```
 \begin{aligned} x &= int(input("Enter 1st number:")) \\ y &= int(input("Enter 2nd number:")) \\ i &= 1 \\ while(i <= x \text{ and } i <= y): \\ if(x \% i == 0 \text{ and } y\% i == 0): \\ gcd &= i \\ i &= i+1 \\ print("GCD :", gcd) \end{aligned}
```

OUTPUT

Enter 1st number: 120 Enter 2nd number: 5

GCD: 5

DATE:29/11/2021

AIM: From a list of integers, create a list removing even numbers.

num = [1,2,3,4,5,6,7,8,9,10]
print("Original list:",num)
num = [x for x in num if x%2!=0]
print("list after removing Even numbers:",num)

OUTPUT

Original list: [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]

list after removing Even numbers: [1, 3, 5, 7, 9]

II. COURSE OUTCOME 2(CO2)

PROGRAM NO: 1

DATE:01/12/2021

AIM: Program to find the factorial of a number

```
n=int(input('Enter a number : '))
f=1
for i in range(1,n+1):
    f=f*i
print ('Factorial of',n, '=',f)
```

OUTPUT

Enter a number : 5Factorial of 5 = 120

DATE:01/12/2021

AIM: Generate Fibonacci series of N terms

```

AIM: Create a package graphics with modules rectangle, circle and sub-package 3D-graphics with modules cuboid and sphere. Include methods to find area and perimeter of respective figures in each module. Write programs that finds area and perimeter of figures by different importing statements. (Include selective import of modules and import * statements)

Graphics package:

```
rectangle.py
```

```
def rectangle(l,b):

print("Area of rectangle :",l*b)

print("Perimeter of rectangle :",2*(l+b))

print("-----")
```

circle.py

```
def circle(r):
    print("Area of Circle :",3.14*r*r)
    print("Perimeter of rectangle :",2*3.14*r)
    print("-----")
```

cuboid.py

```
def cuboid(l,b,h):
    print("Area of cuboid :",(2*1*b)+(2*1*h)+(2*1*b))
    print("Perimeter of cuboid :",4*(l+b+h))
    print("------")
```

sphere.py

```
def sphere(r):

print("Area of sphere :",4*3.14*r*r)

print("Volume of sphere :",(4/3)*3.14*r*r)

print("-----")
```

appackage_views.py

```
from Graphics import circle
from Graphics import rectangle
from Graphics import cuboid
from Graphics import sphere
1 = \text{int(input("Enter length of rectangle :"))}
```

```
b = int(input("Enter breadth of rectangle :"))
rectangle.rectangle(l,b)
r = int(input("Enter Radius of circle :"))
circle.circle(r)
l = int(input("Enter length of cuboid :"))
b = int(input("Enter breadth of cuboid :"))
h = int(input("Enter height of cuboid:"))
cuboid.cuboid(l,h,b)
r = int(input("Enter Radius of sphere :"))
sphere.sphere(r)
OUTPUT
Enter length of rectangle:8
Enter breadth of rectangle :4
Area of rectangle: 32
Perimeter of rectangle: 24
Enter Radius of circle:5
Area of Circle: 78.5
Perimeter of rectangle: 31.400000000000002
Enter length of cuboid:6
Enter breadth of cuboid:3
Enter height of cuboid:4
Area of cuboid: 132
Perimeter of cuboid: 52
Enter Radius of sphere:5
Area of sphere: 314.0
Volume of sphere: 104.6666666666667
```

IV. COURSE OUTCOME 4(CO4)

PROGRAM NO: 1

DATE:09/01/2022

AIM: Create Rectangle class with attributes length and breadth and methods to find area and perimeter. Compare two Rectangle objects by their area

```
class Rectangle:
  def init (self):
    self.l=int(input("Enter the length : "))
    self.b=int(input("Enter the breadth : "))
    self.area=self.l*self.b
    self.perimeter=2*(self.l+self.b)
  def display(self):
    print("Area of Rectangle : ",self.area)
    print("Perimeter of Rectangle : ",self.perimeter)
print("\nFirst Rectangle")
print("----")
p1=Rectangle()
p1.display()
print("\nSecond Rectangle")
print("----")
p2=Rectangle()
p2.display()
if p1.area>p2.area:
  print("----")
  print("First Rectangle with Area", p1.area, "has larger area.")
else:
  print("----")
  print("Second Rectangle with Area",p2.area,"has larger area.")
OUTPUT
First Rectangle
-----
Enter the length: 8
Enter the breadth: 6
Area of Rectangle: 48
Perimeter of Rectangle: 28
Second Rectangle
Enter the length: 10
Enter the breadth: 5
Area of Rectangle: 50
Perimeter of Rectangle: 30
_____
Second Rectangle with Area 50 has larger area.
```

DATE:09/01/2022

AIM: Create a Bank account with members account number, name, type of account and balance. Write constructor and methods to deposit at the bank and withdraw an amount from the bank.

```
class bank:
  def __init__(self):
    self.balance=0
    name=input("Enter the name of account holder: ")
    acno=int(input("Enter the account no : "))
    print ("\n---The account is created---")
    print("\nName of Account Holder: ",name)
    print("\nAccount no : ",acno)
  def deposit(self):
    amount=int(input("\nEnter the amount to deposit : "))
    self.balance+=amount
  def withdraw(self):
    amount = float(input("Enter amount to be Withdrawn : "))
    if (self.balance>=amount):
       self.balance-=amount
       print("\nYou Withdraw:", amount)
       print("\nInsufficient balance!!!")
  def display(self):
    print("\nAvailable Balance : ",self.balance)
b=bank()
b.deposit()
b.withdraw()
b.display()
OUTPUT
Enter the name of account holder: SREERAG T V
Enter the account no: 030303
---The account is created---
Name of Account Holder: SREERAG T V
Account no: 30303
Enter the amount to deposit: 10000000
Enter amount to be Withdrawn: 5000000
You Withdraw: 5000000.0
Available Balance: 5000000.0
```

DATE:09/01/2022

AIM: Create a class Rectangle with private attributes length and width. Overload '<' operator to compare the area of 2 rectangles.

```
class rectangle:
  def __init__(self,length,width):
     self.__length=length
     self.__width=width
  def __lt__(self,a1):
     area1=self.__length*self.__width
     area2=a1.__length*a1.__width
     if(area1<area2):</pre>
       return(True)
     else:
       return(False)
a1=int(input("Length of First Rectangle:"))
b1=int(input("Width of First Rectangle:"))
r1=rectangle(a1,b1)
a2=int(input("Length of Second Rectangle:"))
b2=int(input("Width of Second Rectangle:"))
r2=rectangle(a2,b2)
if(r1<r2):
  print("Second Rectangle is larger.")
else:
  print("First Rectangle is larger.")
OUTPUT
Length of First Rectangle:80
Width of First Rectangle:40
Length of Second Rectangle:50
Width of Second Rectangle:30
First Rectangle is larger.
```

DATE:09/01/2022

AIM: Create a class Time with private attributes hour, minute and second. Overload '+' operator to find sum of 2 time.

```
class Time:
  def __init__(self,hour,minute,second):
    self. hour=hour
    self.__minute=minute
    self.__second=second
  def __add__(self,h):
    second=self.__second+h.__second
    minute=self.__minute+h.__minute
    hour=self.__hour+h.__hour
    if(second>60):
       second=second-60
       minute=minute+1
    if(minute>60):
       minute=minute-60
       hour=hour+1
    if(hour>24):
       hour=hour-24

AIM: Create a class Publisher (name). Derive class Book from Publisher with attributes title and author. Derive class Python from Book with attributes price and no_of_pages. Write a program that displays information about a Python book. Use base class constructor invocation and method overriding.

```
class publisher:
 def __init__(self,pname):
  self.pname=pname
 def display(self):
 print("Publisher Name:",self.pname)
class book(publisher):
 def get(self,title,author):
  self.title=title
  self.author=author
 def display(self):
 print("Title Name:",self.title)
 print("Author Name:",self.author)
class python(book):
def __init__(self,price,nop,pname):
 super().__init__(pname)
 self.price=price
 self.nop=nop
def details(self):
 print("Price:",self.price)
 print("No of pages:",self.nop)
s1=python(200,180,"A P J Abdul kalam")
s1.get("Wings Of Fire","A P J Abdul kalam")
s1.display()
s1.details()
OUTPUT
```

Title Name: Wings Of Fire

Author Name: A P J Abdul kalam

Price: 200

No of pages: 180

V. COURSE OUTCOME 5(CO5)

PROGRAM NO: 1

DATE:30/01/2022

AIM: Write a Python program to read a file line by line and store it into a list.

```
f1=open("firstfile.txt","w")\\ f1.write("This is my first file in python.\nWant to work with files.\nThis is my third line.")\\ f1.close()\\ f1=open("firstfile.txt","r")\\ f1.seek(0,0)\\ ff=f1.readlines()\\ for x in range(0,len(ff)):\\ print(ff[x])\\ print(f)\\ f1.close()
```

OUTPUT

This is my first file in python.

Want to work with files.

This is my third line.

['This is my first file in python.\n', 'Want to work with files.\n', 'This is my third line.']

DATE:30/01/2022

AIM: Python program to copy odd lines of one file to other

```
f1 = open("firstfile.txt","r")
f2=open("odd.txt","w")
for x in f1:
    print(x)
print("-----")
f1.seek(0,0)
ff=f1.readlines()
for x in range(0,len(ff)):
    if(x%2==0):
        f2.write(ff[x])
        print("-----")
```

OUTPUT

This is my first file in python.

Want to work with files.

This is my third line.

This is my first file in python.

This is my third line.

firstfile.txt

This is my first file in python.

Want to work with files.

This is my third line.

odd.txt

This is my first file in python.

This is my third line.

DATE:30/01/2022

AIM: Write a Python program to read each row from a given csv file and print a list of strings

```
import csv
filename = "username.csv"
rows = []
cf=open(filename, 'r')
csvreader = csv.reader(cf)
for r in csvreader:
   rows.append(r)
print(rows)
cf.close()
```

OUTPUT

[['Username; Identifier;Firstname;Lastname'], ['booker12;9012;Rachel;Booker'], ['grey07;2070;Laura;Grey'], ['johnson81;4081;Craig;Johnson'], ['jenkins46;9346;Mary;Jenkins'], ['smith79;5079;Jamie;Smith']]

DATE:30/01/2022

AIM: Write a Python program to read specific columns of a given CSV file and print the content of the columns.

```
import csv
filename = "Names1.csv"
cf=open(filename, 'r')
#csvreader = csv.reader(cf)
data = csv.DictReader(cf)
print("No Company")
for r in data:
    print(r['No'], r['Company'])
```

OUTPUT

No Company

- 1 Ferrari
- 2 Porsche
- 3 Bugatti
- 4 Rolls Royce
- 5 BMW

DATE:30/01/2022

5 BMW BMW X7

AIM: Write a Python program to write a Python dictionary to a csv file. After writing the CSV file read the CSV file and display the content

```
import csv
field_names = ['No', 'Company', 'Car Model']
cars = [
{'No': 1, 'Company': 'Ferrari', 'Car Model': '488 GTB'},
{'No': 2, 'Company': 'Porsche', 'Car Model': '918 Spyder'},
{'No': 3, 'Company': 'Bugatti', 'Car Model': 'La Voiture Noire'},
{'No': 4, 'Company': 'Rolls Royce', 'Car Model': 'Phantom'},
{'No': 5, 'Company': 'BMW', 'Car Model': 'BMW X7'},
1
with open('Names1.csv', 'w') as csvfile:
  writer = csv.DictWriter(csvfile, fieldnames = field_names)
  writer.writeheader()
  writer.writerows(cars)
filename = "Names1.csv"
cf=open("Names1.csv", 'r')
rows=[]
csvreader = csv.reader(cf)
for r in csvreader:
 rows.append(r)
for r in rows:
    print(*r)
OUTPUT
No Company Car Model
1 Ferrari 488 GTB
2 Porsche 918 Spyder
3 Bugatti La Voiture Noire
4 Rolls Royce Phantom
```
